

# The `latexbug` package\*

The L<sup>A</sup>T<sub>E</sub>X Team

2021/01/02

This file is maintained by the L<sup>A</sup>T<sub>E</sub>X Project team.  
Bug reports can be opened (category `latex`) at  
<https://latex-project.org/bugs.html>.

## 1 Introduction

Software has bugs and L<sup>A</sup>T<sub>E</sub>X unfortunately is no exception. If somebody encounters a bug then it helps if that bug gets reported to the right people so that the bug can be resolved (or a workaround documented or whatever is most appropriate). The problem is to know to whom to report the bug.

The L<sup>A</sup>T<sub>E</sub>X Project Team maintains a bug database for its own code base (which consists of the L<sup>A</sup>T<sub>E</sub>X kernel and some packages that have been written by people in the L<sup>A</sup>T<sub>E</sub>X Project Team). However, the L<sup>A</sup>T<sub>E</sub>X universe consists of several thousand contributed packages maintained by individuals all over the world. And if a bug happens in one of those packages it doesn't help anybody if it is dumped at the L<sup>A</sup>T<sub>E</sub>X Project's doorstep.

For one, we can't actually change other people's code even if we are able to identify the issue. Furthermore we are only a few people and simply do not have the bandwidth to analyze bugs in other people's work.

We have therefore written this little package called `latexbug` that should help in identifying the rightful addressee for a bug report. We ask that it will be loaded in any test file that is intended to be sent to the L<sup>A</sup>T<sub>E</sub>X bug database as part of a bug report.

The package will determine if the test file is in a suitable state to be sent to us or if it should be modified first or if it should be sent to somebody else because the bug is (likely) to be in code not maintained by the L<sup>A</sup>T<sub>E</sub>X Project Team.

Bug reports sent to the L<sup>A</sup>T<sub>E</sub>X bug database without that prior verification are likely to get closed without being looked at at our end in the future.

---

\*This file has version number v1.0i, last revised 2021/01/02.

## 2 The user interface

The user interface is simple: the package has no option and doesn't define any new commands to be used. All that is required is that the package is loaded as the very first step in the test file that shows the bug — in other words before the `\documentclass`. For that reason it must be loaded using `\RequirePackage` instead of the usual `\usepackage` that is used in the preamble of a document.

Thus, a bug report test files should look like this:

```
\RequirePackage{latexbug}      % <- required first line
                                %   followed by:
\documentclass{article}       % or some other class
                                %   followed by:
...                            % <- code showing the bug ...
\end{document}
```

If the test file runs through (showing the bug) without any complains for `latexbug` then the test file is ready to be sent to the L<sup>A</sup>T<sub>E</sub>X bug database. The procedure for uploading and the location is documented at

<https://www.latex-project.org/bugs/>

If `latexbug` does generate an error, however, then this error needs to be addressed first and the depending on the resolution the bug report may has to be sent to somebody else.

An error is generated if the test file makes use of third-party code that is not maintained by the L<sup>A</sup>T<sub>E</sub>X Project Team. For example, if the file would load `geometry`, `footmisc` and `hyperref` you would see the following:

```
Package latexbug Error: Third-party file(s)
(latexbug)
(latexbug)          This test file uses third-party file(s)
(latexbug)
(latexbug)          =====
(latexbug)          geometry.sty -> Hideo Umeki
(latexbug)          <latexgeometry [at] gmail [dot] com>
(latexbug)          footmisc.sty
(latexbug)          hyperref.sty -> LaTeX Team
(latexbug)          https://github.com/latex3/hyperref/issues
(latexbug)          =====
(latexbug)
```

It then continues with advice to remove such third-party code from the test file. If that is not possible, because the bug goes away if a package is removed, then the problem is (most likely) with this package and the bug report should be sent to the maintainer of that package and not to the L<sup>A</sup>T<sub>E</sub>X bug database.

```
(latexbug)          So you should contact the authors
```

```
(latexbug)          of these files, not the LaTeX Team!
(latexbug)          (Or remove the packages that load
(latexbug)          them, if they are not necessary to
(latexbug)          exhibit the problem).
```

To make life somewhat easier `latexbug` will tell you the name of the maintainer (if we know it and have added it in) and if possible also the canonical bug address for the package (like in the case of `geometry` and `hyperref`). If we don't have that information, you need to find it out for yourself by looking at the package documentation.

There may be cases where third-party code is essential to exhibit a bug in core L<sup>A</sup>T<sub>E</sub>X code maintained by the the L<sup>A</sup>T<sub>E</sub>X Team. The error text therefore finishes off with the following sentence:

```
(latexbug)          If you think the bug is in core LaTeX
(latexbug)          (as maintained by the LaTeX Team) but
(latexbug)          these files are needed to demonstrate
(latexbug)          the problem, please continue and mention
(latexbug)          this explicitly in your bug report
(latexbug)          (with an explanation why you think so).
```

Please explain your reasoning why you think this is the case in detail as part of the bug report.

*Thank you for taking the time to report a bug and  
prepare a test file showing it!*

## 2.1 A note on the database content in the package

When a document is run through L<sup>A</sup>T<sub>E</sub>X it will load a number of files and bug reports that are to be sent to the L<sup>A</sup>T<sub>E</sub>X Team should only load files that we maintain and not third-party packages.

The database, if you want to call that, inside `latexbug` is simply a comma separated key value list consisting of file names = maintainer info. Most of the time the maintainer info is `us` or `us*` (meaning we maintain it, so the file is fine) or `ignore` (meaning we do not maintain it, but it is a file that is likely to appear for one or the other reason and we should accept such a bug report nonetheless).

Any file loaded in the bug report not listed will show up in the error listing flagged as “third-party” code that should be removed as explained above.

For a small number of popular third-party packages we have collected the name of the external maintainer and if available to us some extra info so that it is easier to send to the rightful addressee if you encounter a bug in such a third-party package. But to keep this manageable this is only done for a very small number of the 5000+ packages out there (though we might add one or the other over time).

It is however not impossible that we missed one or the other file that should have been listed as “maintained by us” but isn’t and thus incorrectly generates an error. If you run into that problem or notice an omission of that sort, please send us a bug report or open an issue at the GitHub source of the package which is located at:

<https://github.com/latex3/latexbug/>

### 3 The documentation driver file

The next bit of code contains the documentation driver file for T<sub>E</sub>X, i.e., the file that will produce the documentation you are currently reading. It will be extracted from this file by the `docstrip` program.

```

1 <*driver>
2 \RequirePackage{latexbug}
3 \documentclass{ltxdoc}
4 \GetFileInfo{latexbug.sty}
5 %\usepackage{geometry,footmisc,hyperref} % uncomment for latexbug error
6 %\usepackage{xparse} % uncomment for latexbug error
7 \EnableCrossrefs
8 %\DisableCrossrefs % Say \DisableCrossrefs if index is ready
9 %\OnlyDescription % Comment out for implementation details
10 \begin{document}
11 \DocInput{latexbug.dtx}
12 \end{document}
13 </driver>
```

### 4 The implementation

```

14 <*package>
15 \NeedsTeXFormat{LaTeX2e}
16 \ProvidesPackage{latexbug}[2021/01/02 v1.0i Bug-classification]

\latexbug@empty Fixed text used in checking what actions to take with different files.
\latexbug@us    \def\latexbug@empty{}
\latexbug@ustar \def\latexbug@us{us}
\latexbug@ignore \def\latexbug@usstar{us*}
\def\latexbug@ignore{ignore}

\Contact A very simple piece of markup, really.
21 \def\Contact{\MessageBreak \@spaces}
```

The database of packages is set up in a group so we can throw away the loop command.

```
22 \begingroup
```

`\latexbug@loop` A simple loop set up which reads a known format for the file-to-maintainer mapping. The trailing space is important (stripping it is not really worth it for this very limited use case).

```
23 \long\def\latexbug@loop #1 = #2 , {% spaces matter
24 \global\@namedef{\latexbug@@#1}{#2}%
25 \ifx\latexbug@empty#1\else\expandafter\latexbug@loop\fi}
```

A simple database of files. The value `us` means we accept bugs for it. We also take bug reports for `us*` (expl3) entries, but they need to go to a different GitHub repository, so are handled separately (and only show up if there doesn't seem to be anything else to pick up). A value of `ignore` means that its not our code, but we understand that it may show up in legitimate test files and should therefore not trigger an error.

Any file not in there will trigger an error if loaded and any file in there with some other value than `us` or `ignore` will also trigger an error displaying the value (which hopefully is the maintainers name). (Handling for `us*` means these files may not show up, depending on the nature of the use case.)

*The database format is somewhat fragile: one needs to have a space on both sides of the equal sign (or one gets a nasty low-level error) and names can't have no-ascii characters in them, so they end up crippled (sorry for that).*

```
26 \latexbug@loop

```

```

\@addtofilelist First, a test to see if we are at the top level: there's no need to test dependencies
\latexbug@iftoplevel of packages. Assuming we are doing a check, the aim is to see if the current name
is known, and if it is whether it fits into one of our special cases. If it's one of
the LATEX3 GitHub packages it gets recorded in a dedicated space. Third-party
package can also have information about where to report issues: this is all stored

```

for reporting later.

```
